Finnair Selects Engine Supplier to Increase Fuel Efficiency

September 20, 2012 10:46 PM

Finnair selected IAE International Aero Engines AG to supply engines for its five new Airbus A321 extended-range aircraft, entering the Finnair fleet in September 2013. The IAE V2533-A5 engines offer Finnair a significant advantage in fuel efficiency over the competition, saving about 300 tons of fuel per year per aircraft, according to aircraft supplier Airbus test data. The engines also operate well within noise limitations set by ICAO and the EU.

Finnair announced in June 2010 an order for five Airbus aircraft to replace the four Boeing 757s currently in the fleet. The new A321s will be quieter and more comfortable for passengers, as well as about 5 percent more fuel efficient. The move also enables more flexibility and interoperability between European scheduled and leisure flights, driving up aircraft utilization and further reducing per-passenger emissions.

"A modern fleet is an investment in Finnair's future," said Kati Ihamäki, vice president sustainable development. "Especially in the emissions trading era, sourcing decisions like this have an appreciable effect on our bottom line, not to mention savvy and well-informed customers looking for greener choices when flying."
